Work Experience

Jacto Agrícola – R&D

R&D Software Engineer & Team Leader

Pompéia, SP

Oct 2023– Present

- Lead a team of 6, providing technical direction, task allocation, code reviews, mentoring, architectural guidance, and cross-team coordination; have previously led a total of 10 people across different initiatives.
- Initiated and co-designed the transition from monolithic embedded applications toward a 16–20-service architecture, securing resources and driving early prototypes focused on maintainability, reusability, testability, and fault isolation.
- Delivered the complete migration of a next-generation agricultural-machinery HMI from Qt Widgets to QML, restructuring C++/QML interactions and converting 300+ UI components into a QML/C++ architecture deployed on embedded Linux hardware with 7-, 8-, and 10-inch displays.
- Developed a remote-access system for agricultural machinery using REST, WebSockets, JWT authentication, and AWS KVS, supporting remote configuration, screen sharing, log extraction, and software updates across programmable electronic modules ranging from STM controllers to GPS antennas.
- Lead a three-stage software quality initiative that reduced the software validation cycle from 20 iterations to 2, while introducing Cppcheck and AddressSanitizer, developing automated E2E testing with Squish and simulated CAN communication, and establishing unit/integration testing for the planned microservice architecture.
- Diagnosed and resolved defects across 5 embedded software projects and 7–10 repositories, investigating issues ranging from protocol communication and supplier inconsistencies to memory management and UI behavior across C++/QML applications deployed across 7 machine types, over 400 total machines annually.

Giorgio – Chatbot

CTO & Co-Founder

São Paulo, SP

Jan 2023–Aug 2024

- Led a 4-person team in designing, building, and operating a WhatsApp-based B2B chatbot platform, taking end-to-end ownership of architecture, implementation, code reviews, client communication, testing, and delivery; initially deployed for a wine retailer.
- Designed a configurable, multi-stage conversation workflow in which each linked stage defined its own logic, success criteria, and responsibilities, allowing chatbot flows to be adapted to different business requirements.
- Built and operated the delivery infrastructure using Python/Flask, Docker, and AWS ECS; implemented CI, automated unit and integration testing, monitoring, and logging, and used Memcached to manage real-time conversation state while avoiding the higher operating cost of Redis. Retained a manual final deployment approval to validate release readiness.
- Integrated the WhatsApp Business API, OpenAI Chat API, HTTPS REST APIs and webhooks, and HubSpot CRM, enabling customer conversations, AI-generated responses, configurable business data, and conversation logging in a single platform.

Giorgio – App

Software Engineer & Co-Founder

São Paulo, SP

Oct 2021– Jan 2023

- Built the backend for Giorgio, an iOS/Android local-experience discovery app, using Python/Flask and Google Cloud Functions, Firestore, and Cloud Storage; supported approximately 1,000 weekly active users and 300 recurring users across travel-planning and same-day local-recommendation product iterations.
- Owned backend architecture and implementation largely independently, designing APIs, data models, and application logic while coordinating technical decisions with experienced advisors and guiding an intern who contributed to selected features.
- Designed a GitHub Actions delivery pipeline that ran unit and integration tests, built Docker images, and published them to cloud infrastructure; retained manual production-release approval to verify version readiness before deployment.
- Led the migration of backend and media services from Google Cloud to AWS Lambda, S3, and load balancers, using AWS onboarding credits to reduce monthly cloud expenses by approximately 80%.
- Built Google Data Studio dashboards to track daily, weekly, and monthly active users, returning users, and time in app, plus weekly churn reporting, giving the team a consistent view of product engagement.
- As a technical lead and 25% equity holder, supported a R\$100k angel-investment round at a R\$1 million post-money valuation through technical product demonstrations and live-demo infrastructure.

- Automated recurring Strategy, Planning & Analysis (SP&A) reporting with Python and Airflow, refreshing daily and weekly Google Sheets dashboards and sending automated Slack alerts; replaced analyst-dependent updates with consistently available data for stakeholders.
- Implemented company-wide Power BI, Google Sheets, and Excel dashboards using SQL queries against Snowflake, translating stakeholder specifications into business logic and KPI reporting for SP&A and Growth teams.
- Developed leadership dashboards that queried live SQL data and refreshed every 5 minutes, providing near-real-time visibility into critical customer and operational demands.
- Built reporting dashboards for major Growth campaigns, including Black Friday, Christmas, Easter, and Father’s Day, tracking active, returning, and churned users alongside GMV and sales by product, vertical, and category.

Education

Mechatronic Engineering, POLI USP Bachelor’s Degree	<i>Graduation Date: Dec 2020</i>
Shibaura Institute of Technology (Japan) Exchange Program	<i>Graduation Date: Jul 2019</i>

Skills & Certificates

Foreign Languages: Portuguese (native); English (advanced - TOEFL iBT 98/120); Spanish, Chinese, Japanese
Core: C++, QML/Qt, Python, SQL, Git, Docker
Embedded & Systems: CAN bus, RS-232, REST/WebSockets, AWS Kinesis Video Streams
Cloud & Delivery: AWS, Google Cloud, GitHub Actions, CI, automated testing
Analytics: Snowflake, Power BI, Google Sheets, Excel
Certificates: [Startup Program](#), [Machine Learning](#), [Excel VBA](#)
